

Racing Lake St. Clair

Help

Notice:

It most likely that this document will appear quite haphazard and disorganized. It is under development and when it is sufficiently firmed up, I will remove this notice.

Comments and suggestions are always welcome!

Cheers!

Steve LaMont

Introduction

Racing Lake St. Clair has been developed to provide a user based global resource that allows visitors to quickly find posted information by users as well as permitting those users to retain records for their own reference, while providing full ownership control of submitted entries.

The concept of the website developed over time as I began, as a hobby, to learn about web development.

Credit to Chris Kitchen

The development of this system in its current form would not have been possible without the incredible software creation written and owned by Chris Kitchen. The "MATE" (MySQL Ajax Table Editor) framework is a phenomenal product with a free version available or a one-time payment of \$18.99 per site. The setup is easy with Chris' examples providing a clear path to successful installation on your website.

Here is the link to the MATE site. <https://mysqlajaxtableeditor.com/GetMateNow.php>.

What is Scope?

Setting a SCOPE filters data based on a category. Two factors are involved. Choosing the SCOPE description and enabling it (or disabling it). The Scope allows a user to restrict data in the directory. Eventually, this will allow groups to be formed and membership of each group to be controlled by a group administrator. It is the intention to have public and private groups. **(Still under design)**.
